Preface

The hardware and software described in this document are products of KEB. The information contained in this document is valid at the time of publishing. KEB reserves the right to update this document in response to misprints, mistakes or technical changes.

Signal words and symbols

Certain procedures within this document can cause safety hazards during the installation or operation of the device. Refer to the safety warnings in this document when performing these procedures. Safety signs are also located on the device where applicable. A safety warning is marked by one of the following warning signs:

 DANGER	Dangerous situation, which will cause death or serious injury if this safety warning is ignored.
 WARNING	Dangerous situation, which may cause death or serious injury if this safety warning is ignored.
 CAUTION	Dangerous situation, which may cause minor injury if this safety warning is ignored.
NOTICE	Situation, which can cause damage to property if this safety warning is ignored.

RESTRICTION

Used when the following statements depend on certain conditions or are only valid for certain ranges of values.

Used for informational messages or recommended procedures.

Laws and guidelines

KEB Automation KG confirms with the EC declaration of conformity and the CE mark on the device nameplate that it complies with the essential safety requirements.

The EC declaration of conformity can be downloaded on demand via our website.

Warranty and liability

The warranty and liability on design, material or workmanship for the acquired device is given in the general sales conditions.

Here you will find our general sales conditions.

<https://www.keb-automation.com/terms-conditions>

Further agreements or specifications require a written confirmation.

Support

Although multiple applications are referenced, not every case has been taking into account. If you require further information or if problems occur which are not referenced in the documentation, you can request the necessary information via the local KEB agency.

The use of our units in the target products is outside of our control and therefore lies exclusively in the area of responsibility of the customer.

The information contained in the technical documentation, as well as any user-specific advice in spoken and written and through tests, are made to best of our knowledge and information about the intended use. However, they are regarded as being only informal and changes are expressly reserved, in particular due to technical changes. This also applies to any violation of industrial property rights of a third-party. Selection of our units in view of their suitability for the intended use must be done generally by the user.

Tests can only be done within the intended end use of the product (application) by the customer. They must be repeated, even if only parts of hardware, software or the unit adjustment are modified.

Copyright

The customer may use the instructions for use as well as further documents or parts from it for internal purposes. Copyrights are with KEB and remain valid in its entirety.

This KEB product or parts thereof may contain third-party software, including free and/or open source software. If applicable, the license terms of this software are contained in the instructions for use. The instructions for use are already available to you, can be downloaded free of charge from the KEB website or can be requested from the respective KEB contact person.

1 Basic Safety Instructions

The products are designed and constructed in accordance with state-of-the-art technology and the recognized safety rules and regulations. However, the use of such devices may cause functional hazards for life and limb of the user or third parties, or damages to the system and other material property.

The following safety instructions have been created by the manufacturer for the area of electric drive technology. They can be supplemented by local, country- or application-specific safety instructions. This list is not exhaustive. Violation of the safety instructions by the customer, user or other third party leads to the loss of all resulting claims against the manufacturer.

NOTICE

Hazards and risks through ignorance!

- ▶ Read the instructions for use!
- ▶ Observe the safety and warning instructions!
- ▶ If anything is unclear, please contact KEB Automation KG!

1.1 Target group

This instruction manual is determined exclusively for electrical personnel. Electrical personnel for the purpose of this instruction manual must have the following qualifications:

- Knowledge and understanding of the safety instructions.
- Skills for installation and assembly.
- Start-up and operation of the product.
- Understanding of the function in the used machine.
- Detection of hazards and risks of the electrical drive technology.
- Knowledge of *VDE 0100*
- Knowledge of national safety regulations.

1.2 Transport, storage and proper use

The transport is carried out by qualified persons in accordance with the environmental conditions specified in this manual. Drive controller shall be protected against excessive strains.

Transport of drive controllers with an edge length >75 cm

The transport by forklift without suitable tools can cause a deflection of the heat sink. This leads to premature aging or destruction of internal components.

- ▶ Transport of drive controllers on suitable pallets.
- ▶ Do not stack drive controllers or burden them with other heavy objects.

NOTICE

Damage to the coolant connections

Bending of the tubes!

- ▶ Never place the device on the coolant connections

Drive controllers contain electrostatic sensitive components.

- ▶ Avoid contact.
 - ▶ Wear ESD-protective clothing.
-

Do not store drive controllers

- in the environment of aggressive and/or conductive liquids or gases.
- with direct sunlight.
- outside the specified environmental conditions.

1.3 Installation

⚠ DANGER

Do not operate in an explosive environment!

- ▶ The product is not intended for the use in potentially explosive environment.
-

⚠ CAUTION

Design-related edges and high weight!

Contusions and bruises!

- ▶ Never stand under suspended loads.
 - ▶ Wear safety shoes.
 - ▶ Secure drive controller accordingly when using lifting gear.
-

To prevent damages to the device:

- Make sure that no components are bent and/or isolation distances are changed.
- The device must not be put into operation in case of mechanical defects.
- Do not allow moisture or mist to penetrate the unit.
- Avoid dust permeating the device. Allow for sufficient heat dissipation if installed in a dust-proof housing.
- Note installation position and minimum distances to surrounding elements. Do not cover the ventilation openings.
- Mount the drive controller according to the specified degree of protection.
- Make sure that no small parts fall into the product during assembly and wiring (drilling chips, screws etc.). This also applies to mechanical components, which can lose small parts during operation.
- Check the reliable fit of the device connections in order to avoid contact resistances and sparking.
- Do not walk-on drive controller.
- Follow all safety instructions!

1.4 Electrical connection

DANGER

Voltage at the terminals and in the device!

Danger to life due to electric shock !

- ▶ Never work on the open device or never touch exposed parts.
- ▶ For any work on the unit switch off the supply voltage, secure it against switching on and check absence of voltage by measuring at the input terminals.
- ▶ Wait until all drives has been stopped in order that no regenerative energy can be generated.
- ▶ Await capacitor discharge time (5 minutes). Check absence of voltage by measuring at the DC terminals.
- ▶ If personal protection is required, install suitable protective devices for drive converters.
- ▶ Never bridge upstream protective devices (even for testing purposes).
- ▶ Connect the protective earth conductor always to drive converter and motor.
- ▶ Install all required covers and protective devices for operation.
- ▶ The control cabinet shall be kept closed during operation.
- ▶ Residual current: This product may cause a dc current in the protective earth conductor. When a residual current protective device (RCD) or a residual current monitoring device (RCM) is used for the protection against direct or indirect contact, only a RCD or RCM type B is permitted on the power supply side of this product.
- ▶ Drive converters with a leakage current $> 3.5\text{ mA AC}$ current (10 mA DC current) are intended for a stationary connection. Protective earth conductors must be designed in accordance with the local regulations for equipment with high leakage currents according to *EN 61800-5-1*, *EN 60204-1* or *VDE 0100*.

If personnel protection is required during installation of the system, suitable protective devices must be used for drive controllers.

www.keb.de/fileadmin/media/Techinfo/dr/tn/ti_dr_tn-rcd-00008_en.pdf

Installations which include drive controller shall be equipped with additional control and protective devices in accordance with the relevant applicable safety requirements, e.g. act respecting technical equipment, accident prevention rules etc. They must always be complied with, also for drive controller bearing a CE marking.

For a trouble-free and safe operation, please pay attention to the following instructions:

- The electrical installation shall be carried out in accordance with the relevant requirements.
- Cable cross-sections and fuses must be dimensioned by the user according to the specified minimum/maximum values for the application.
- Connection of the drive converter is only permissible on symmetrical networks with a maximum line voltage (L1, L2, L3) with respect to earth (N/PE) of max. 300V, USA UL: 480 / 277V. An isolating transformer must be used for supply networks which exceed this value! In case of non-compliance the control is not longer considered to be a PELV circuit.
- With existing or newly wired circuits the person installing the units or machines must ensure that the PELV requirements are met.
- For drive converters that are not isolated from the supply circuit (in accordance with [EN 60721-3-2](#)) all control lines must be included in other protective measures (e.g. double insulation or shielded, earthed and insulated).
- When using components without isolated inputs/outputs, it is necessary that equipotential bonding exists between the components to be connected (e.g. by the equipotential line). Disregard can cause destruction of the components by equalizing currents.

1.4.1 EMC-compatible installation

Observance of the limit values required by EMC law is the responsibility of the customer.

Notes on EMC-compatible installation can be found here.
www.keb.de/fileadmin/media/Manuals/dr/emv/0000neb0000.pdf

1.4.2 Voltage test

Testing with AC voltage (in accordance with [EN 60204-1](#) chapter 18.4) may not be executed, since there is danger for the power semiconductors in the drive controller.

Due to the radio interference suppression capacitors, the test generator will switch off immediately with a current fault.

According to [EN 60204-1](#) it is permissible to disconnect already tested components. Drive controllers of the KEB Automation KG are delivered ex works voltage tested to 100% according to product standard.

1.4.3 Insulation measurement

An insulation measurement (in accordance with [EN 60204-1](#) chapter 18.3) with DC 500V is permissible, if all power unit connections (grid-connected potential) and all control connections are bridged with PE. The insulation resistance of the respective device can be found in the technical data.

1.5 Start-up and operation

The start-up (i.e. for the specified application) is forbidden until it is determined that the installation complies with the machine directive; account is to be taken of [EN 60204-1](#).

⚠ WARNING

Software protection and programming!

Hazards caused by unintentional behavior of the drive!

- ▶ Check especially during initial start-up or replacement of the drive controller if parameterization is compatible to application.
- ▶ Securing a unit solely with software-supported functions is not sufficient. It is imperative to install external protective measures (e.g. limit switch) that are independent of the drive controller.
- ▶ Secure motors against automatic restart.

⚠ CAUTION

High temperatures at heat sink and coolant!

Burning of the skin!

- ▶ Cover hot surfaces safe-to-touch.
- ▶ If necessary, attach warning signs on the system.
- ▶ Before touching, check the surface and coolant lines.
- ▶ Before working let the unit cool down.

- During operation, all covers and doors shall be kept closed.
- Use only approved accessories for this device.
- Never touch terminals, busbars or cable ends.

⚠ CAUTION

High sound level during operation!

Hearing damage possible!

- ▶ Wear hearing protection!

NOTICE

Continuous operation (S1) with load > 60% or from a rated motor power of 55 kW!

Premature ageing of the electrolytic capacitors!

- ▶ Mains choke with $U_k = 4\%$ absolutely necessary.

If a drive controller with electrolytic capacitors in a DC link has not been in operation for more than one year, observe the following instructions.

www.keb.de/fileadmin/media/Techinfo/dr/tn/ti_dr_tn-format-capacitors-00009_en.pdf

Switching at the output

Switching between motor and drive controller is prohibited for single drives during operation as this may trigger the protection gear of the device. Function ‚speed search‘ must be activated if switching can not be avoided. Speed search may only be triggered after closing the motor contactor (e.g. by switching the control release).

Connecting and disconnecting is permissible with multiple motor drives if at least 1 motor is running during the switch-over process. The drive controller must be dimensioned to the occurring starting currents.

The ‚speed search‘ function must be activated if the motor is still running during a restart of the drive controller (mains on) (e.g. due to large rotating masses).

Switching at the input

For applications that require cyclic switching off and on of the drive controller, maintain an off-time of at least 5 min after the last switch on. If you require shorter cycle times please contact KEB Automation KG.

Short-circuit resistance

The drive controller are conditional short-circuit proof. After resetting the internal protection devices, the function as directed is guaranteed.

Exceptions:

- If an earth-leakage fault or short-circuit often occurs at the output, this can lead to a defect in the unit.
- If a short-circuit occurs during regenerative operation (2nd or 4th quadrant, regeneration into the DC link), this can lead to a defect in the unit.

1.6 Maintenance

The following maintenance work has to be carried out when required, but at least once per year by authorized and trained personnel. Check unit for loose screws and plugs and tighten if necessary.

- ▶ Check system for loose screws and plugs and tighten if necessary.
- ▶ Clean drive controller from dirt and dust deposits. Pay attention especially to cooling fins and protective grid of the fans.
- ▶ Examine and clean extracted air filter and cooling air filter of the control cabinet.
- ▶ Check the function of the fans of the drive controller. The fan must be replaced in case of audible vibrations or squeak.
- ▶ In the case of liquid-cooled drive controllers a visual test of the cooling circuit for leaks and corrosion must be carried out. The cooling circuit must be completely empty if a unit shall be switched off for a longer period. The cooling circuit must be blown out additionally with compressed air at temperatures below 0°C.

1.7 Repair

In case of malfunction, unusual noises or smells inform a person in charge!

DANGER

Unauthorized exchange, repair and modifications!

Unpredictable malfunctions!

- ▶ The function of the drive controller is dependent on its parameterization. Never replace without knowledge of the application.
- ▶ Modification or repair is permitted only by KEB Automation KG authorized personnel.
- ▶ Only use original manufacturer parts.
- ▶ Infringement will annul the liability for resulting consequences.

In case of failure, please contact the machine manufacturer. Only the machine manufacturer knows the parameterisation of the used drive controller and can provide an appropriate replacement or induce the maintenance.

1.8 Disposal

Electronic devices of the KEB Automation KG are exclusively professional devices for further industrial processing (so-called B2B devices).

Manufacturers of B2B devices are obliged to take back and recycle devices manufactured after 14.08.2018. These devices may not be disposed at the collection centres of public sector disposal organisations.

If no deviating agreement has been made between the customer and KEB or no deviating mandatory legal regulation exists, KEB products marked in this way can be returned. Company and keyword to the return point can be taken from the list below. Shipping costs are paid by the customer. Thereupon the devices will be professionally recycled and disposed.

The entry numbers are listed country-specific in the following table. The corresponding KEB return addresses can be found on our website.

2 Product Description

The device series COMBIVERT F6 concerns to drive controllers, which are optimized for operation at synchronous and asynchronous motors.

The COMBIVERT can be extended with a safety module for the use in safety-oriented applications. The COMBIVERT F6 series are drive controllers with functional safety, optimized for operation at synchronous and asynchronous motors.

Various safety functions are available for different applications. It can be operated with a fieldbus module at different fieldbus systems. The control board has a system comprehensive operating concept.

The COMBIVERT complies with the requirements of the Machinery Directive. The possible functions are certified via a type test.

The COMBIVERT is a product of limited availability in accordance with [EN 61800-3](#). This product may cause radio interference in residential areas. In this case the operator may need to take corresponding measures.

The Machinery Directive, EMC Directive, Low Voltage Directive and other directives and regulations must be observed

2.1 Specified application

The COMBIVERT serves exclusively for the control and regulation of three-phase motors. It is intended for the installation into electrical systems or machines in the industrie.

Technical data and information for connection conditions shall be taken from the nameplate and from the instructions for use and must be strictly observed.

The used semiconductors and components of the KEB Automation KG are developed and dimensioned for the use in industrial products.

Restriction

If the product is used in machines, which work under exceptional conditions or if essential functions, life-supporting measures or an extraordinary safety step must be fulfilled, the necessary reliability and security must be ensured by the machine builder.

2.1.1 Residual risks

Despite intended use, the drive controller can reach unexpected operating conditions in case of error, with wrong parameterization, by faulty connection or unprofessional interventions and repairs. This can be:

- wrong direction of rotation
- motor speed too high
- motor is running into limitation
- motor can be under voltage even in standstill
- automatic start

2.2 Unintended use

The operation of other electric consumers is prohibited and can lead to the destruction of the devices. The operation of our products outside the indicated limit values of the technical data leads to the loss of any liability claims.

2.3 Product features

These instructions for use describe the power units of the following devices:

Device type:	Drive controller
Series:	COMBIVERT F6
Power range:	110...200kW / 400 V
Housing:	7

The COMBIVERT F6 is characterized by the following features:

- Operation of three-phase asynchronous motors and three-phase synchronous motors, in operating modes open-loop or closed-loop with and without speed feedback
- Following fieldbus systems are supported:
EtherCAT, VARAN, PROFINET, POWERLINK or CAN
- System-overlapping operating concept
- Wide operating temperature range
- Low switching losses by IGBT power unit
- Low noise development due to high switching frequencies
- Different heat sink concepts
- Temperature-controlled fan, easily replaceable
- Torque limits and s-curves are adjustable to protect gearboxes
- General protection functions of the COMBIVERT series against overcurrent, over-voltage, ground fault and overtemperature
- Analog inputs and outputs, digital inputs and outputs, relay output (potential-free), brake control and -supply, motor protection by I²t, KTY- or PTC input, two encoder interfaces, diagnostic interface, fieldbus interface (depending on the control board)
- Integrated safety function according to [EN 61800-5-2](#)

- ¹⁾ Rated operation corresponds to $U_N = 400V$, rated switching frequency, output frequency = 50 Hz (4-pole standard asynchronous motor).
- ²⁾ The output frequency must be limited so that it does not exceed 1/10 of the switching frequency. Notice! Devices with a maximum output frequency higher than 599 Hz are subject to export restrictions.
- ³⁾ The values refer in % to the rated output current I_N .
- ⁴⁾ Please note restrictions => „3.2.3.1 Overload characteristic (OL)“.
- ⁵⁾ A detailed description of the Derating => „3.3.1 Switching frequency and temperature“.
- ⁶⁾ The cyclic duration factor is additionally limited by the used braking resistor.
- ⁷⁾ The feedback signal evaluation monitors the functionality of the braking transistor. Power off occurs via the internal mains input bridge of the AC supply. There is no current switch-off with DC power supply.
- ⁸⁾ Only available as fluid cooler (water)
- ⁹⁾ The maximum cable length depends on various factors. Further information can be found in the corresponding filter instructions.

- ¹⁾ The voltage to the motor is dependent on the actual input voltage and the control method („3.2.2.1 Example of the calculation of the possible motor voltage:“).
- ²⁾ The output frequency is to be limited in such a way that it does not exceed 1/10 of the switching frequency. Devices with a maximum output frequency higher than 599Hz are restricted for export.

3.2.2.1 Example of the calculation of the possible motor voltage:

The motor voltage for dimensioning of the drive is depending on the used components. The motor voltage reduces according to the following table:

Component	Reduction / %	Example
Mains choke U_k	4	Open-loop drive controller with mains- and motor choke at non-rigid supply system: 400 V mains voltage (100%) - 36 V reduced voltage (11%) = 356 V motor voltage

²⁾ The values refer in % to the rated output current I_N .

³⁾ Limitation of the current setpoints in closed-loop operation. This setpoint limit is not active in v/f operation.

3.2.3.1 Overload characteristic (OL)

All drive converters can be operated at rated switching frequency with an utilization of 125 % for 60s.

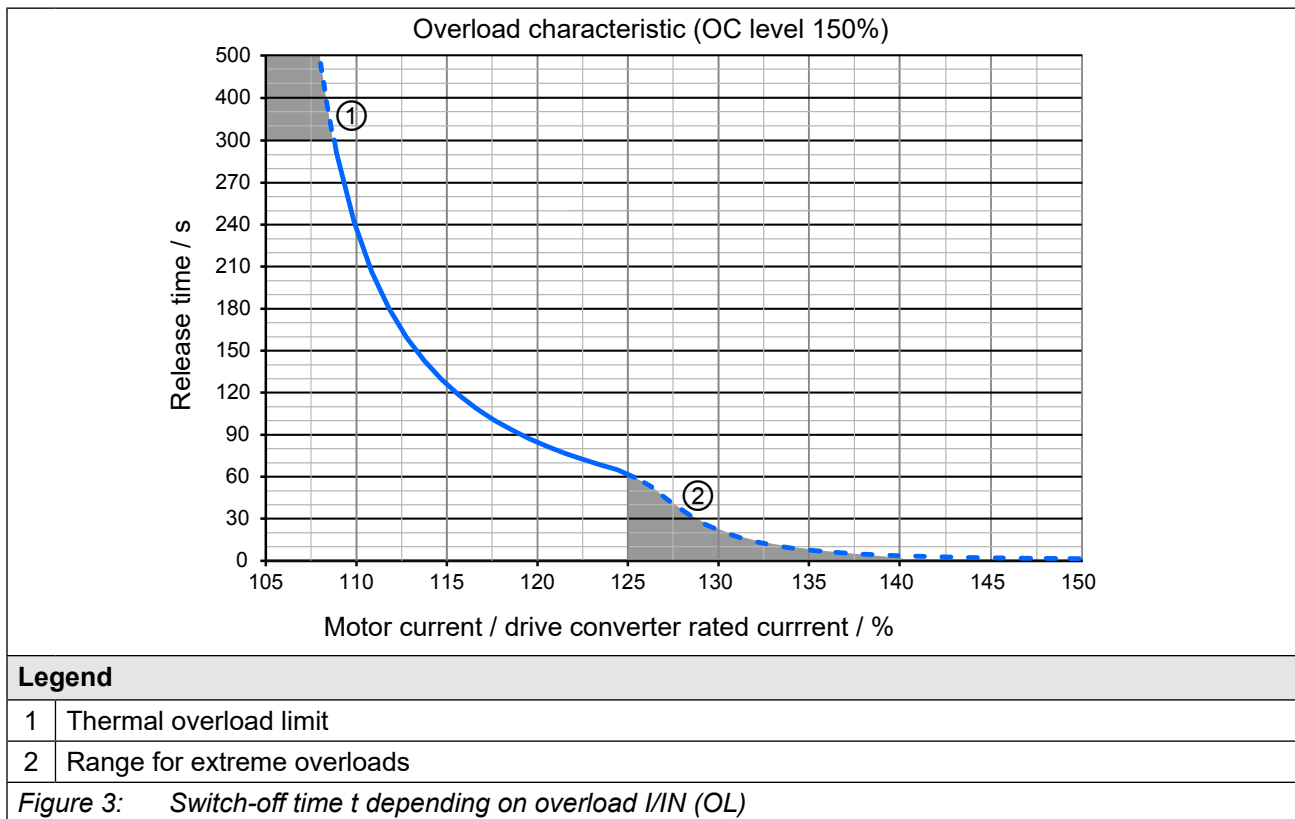

The OL overload function is a root mean square (RMS) function.

The greater the difference between the overload and underload phases, the greater the deviation of the RMS from the arithmetic mean value.

For extreme overloads (=> „Figure 3: Switch-off time t depending on overload I/I_N (OL)“ or) the load is weighted more heavily. This means the load is provided with a factor for the calculation of the RMS value, by way that the overload protection function triggers, even if the RMS value does not reach 100%.

Restrictions:

- The thermal design of the heat sink is based on the rated operation. The following values are taken into account: Rated output current, ambient temperature, rated switching frequency, rated voltage.
- At high surrounding temperatures and/or high heat sink temperatures (for example, by preceding utilization nearby 100%) the drive converter can change to overtemperature error before triggering the protective function OL.
- At low output frequencies or switching frequencies higher than the rated switching frequency, the frequency-dependent maximum current can be exceeded and error OL2 can be triggered
=> „3.2.3.2 Frequency-dependent maximum current (OL2)“.

- On exceeding a load of 105 % the overload integrator starts.
- When falling below the integrator counts backwards.
- If the integrator reaches the overload characteristic „Error! overload (OL)“ is triggered.

After a cooling down period, the integrator can be reset now. The drive converter must remain switched on during the cooling down phase.

Operation in the range of the thermal overload limit

Due to the high slope of the overload characteristic, the duration of a permissible overload in range ① cannot be determined exactly. Therefore, the design of the drive converter should be assumed to have a maximum overload time of 300s.

3.2.3.2 Frequency-dependent maximum current (OL2)

The characteristics of the maximum currents for a switching frequency which are depending on the output frequency are different for each drive controller, but the following rule is generally applicable to housing 7.

- Lower maximum currents apply for switching frequencies > rated switching frequency.

If error (OL2) shall be triggered on exceeding the maximum currents or if the switching frequency is automatically reduced (derating) can be adjusted in the drive converter parameters.

DEVICE DATA OF THE 400V DEVICES

The following characteristic curve indicates the permissible maximum current for the output frequency values 0Hz, 1,5Hz, 3Hz, 6Hz, 10Hz and 25Hz. Device size 28 is represented exemplary.

The frequency-dependent maximum current I_{out_max} refers in % to the rated output current I_N .

The current remains constant from the last specified output frequency value.

The values for the respective device size are listed in the following tables.

NOTICE

Observe the rated voltage of the fuse!

- The rated voltage of the fuse must be at least equal to the maximum DC supply voltage of the drive controller.

3.3 General electrical data

3.3.1 Switching frequency and temperature

The drive controller cooling is designed by way that the heat sink overtemperature threshold is not exceeded at rated conditions. A switching frequency higher than the rated switching frequency also produces higher losses and thus a higher heat sink heating. If the heat sink temperature reaches a critical threshold (T_{DR}), the switching frequency can be reduced automatically step by step. This prevents that the drive controller switches off due to overheating of the heat sink. If the heat sink temperature falls below the threshold T_{UR} , the switching frequency is increased back to the setpoint. At temperature T_{EM} the switching frequency is immediately reduced to rated switching frequency. „Derating“ must be activated, for this function to work.

3.3.2 DC link / braking transistor function

Activation of the braking transistor function

To be able to use the braking transistor, the function must be activated with parameter "is30 braking transistor function".

For more information => [F6 Programming manual](#).

NOTICE

Falling below the minimum braking resistor value!

Destruction of the drive controller

- ▶ The minimum brake resistance value must not fall below!

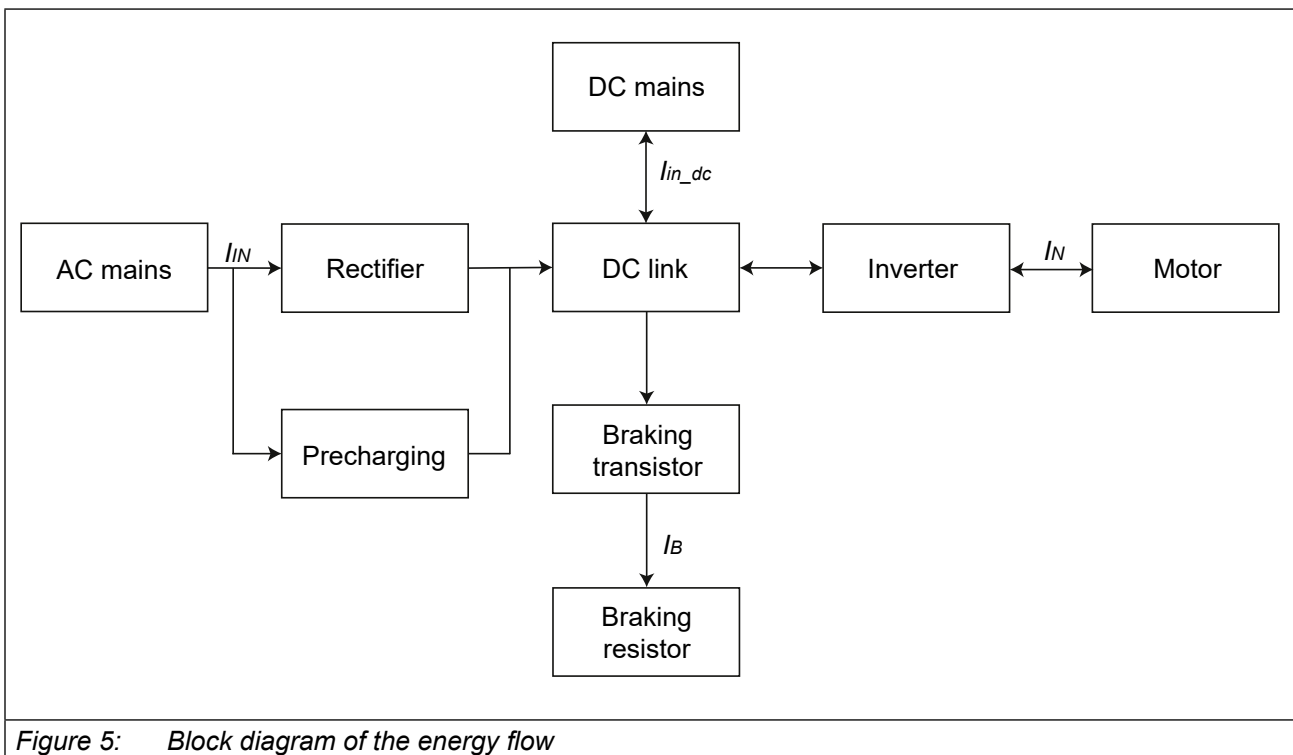

Figure 5: Block diagram of the energy flow

NOTICE

Destruction of the drive controller!

If the error "ERROR GTR7 always ON" occurs, the current consumption is switched off internally via the mains input bridge of the AC supply.

- ▶ If the error "ERROR GTR7 always ON" occurs, the drive controller is defective and must be disconnected from the power supply no later than 16 hours!
- ▶ With DC mains connection and the use of non-intrinsically safe braking resistors or sub-mounted braking resistors, the drive controller must be de-energised after 1 second at the latest.

4.1.8 Devices with transport bracket

The transport bracket can be removed after mounting the drive controller. The transport brackets must be stored to make the drive controller transportable again in case of service.

NOTICE

Damage caused by improper mounting

- ▶ The transport brackets must not be used to fasten the drive controller!

NOTICE

Use of other fixing material

- ▶ The alternatively selected fixing material must meet the above material characteristics (quality) and tightening torques!

The use of other fixing materials is beyond the control of KEB and is therefore the sole responsibility of the customer.

4.2.2 Mounting distances

Power loss for the control cabinet dimension „3.2.5 Power dissipation at rated operation“. A lower value can be used here depending on the operating mode/load.

Mounting the drive controller

For reliable operation, the drive controller must be mounted without any distance on a smooth, closed, metallicly bright mounting plate.

5	Housing (e.g. Control cabinet wall)

Figure 16: Installation of IP54-ready devices

IP54 zone: Heat sink outside the housing

The protection class IP54 can only be achieved when the device is properly installed.

For proper installation, a suitable IP54 seal (=> „5.4.2 Seal for IP54-ready devices“) must be installed between heat sink and housing (e.g. control cabinet wall).

The tightness must be checked after the installation. If properly installed, the separation to the housing corresponds to degree of protection IP54.

In the case of fan-cooled units, the fans must be protected from negative environmental influences.

These include combustible, oily or dangerous fumes or gases, corrosive chemicals, coarse foreign bodies and excessive dust. This applies especially to the access of the heatsink from the top (air outlet).Icing is inadmissible.

UL: Device heat sink is classified as NEMA type 1

IP20 zone: Device inside the housing

This part is intended for the installation in a suitable housing for the required degree of protection (e.g. control cabinet).

The power connections are excluded => „3.1.1 Climatic environmental conditions“.

NOTICE

Defect due to continuous splash water !

- ▶ Never expose the device to continuous splashing water (e.g. direct exposure to rain)!

4.2.4 Control cabinet ventilation

If construction-conditioned the control cabinet cannot be without indoor ventilation, appropriate filters must avoid suction of foreign objects.

5.2 Connection of the power unit

NOTICE

Destruction of the drive controller!

- ▶ Never exchange mains input and motor output!

5.2.1 Connection of the voltage supply

The COMBIVERT F6 can be supplied via terminals L1, L2 and L3 (AC power supply) or via terminals + and - (DC power supply with inrush current limitation)

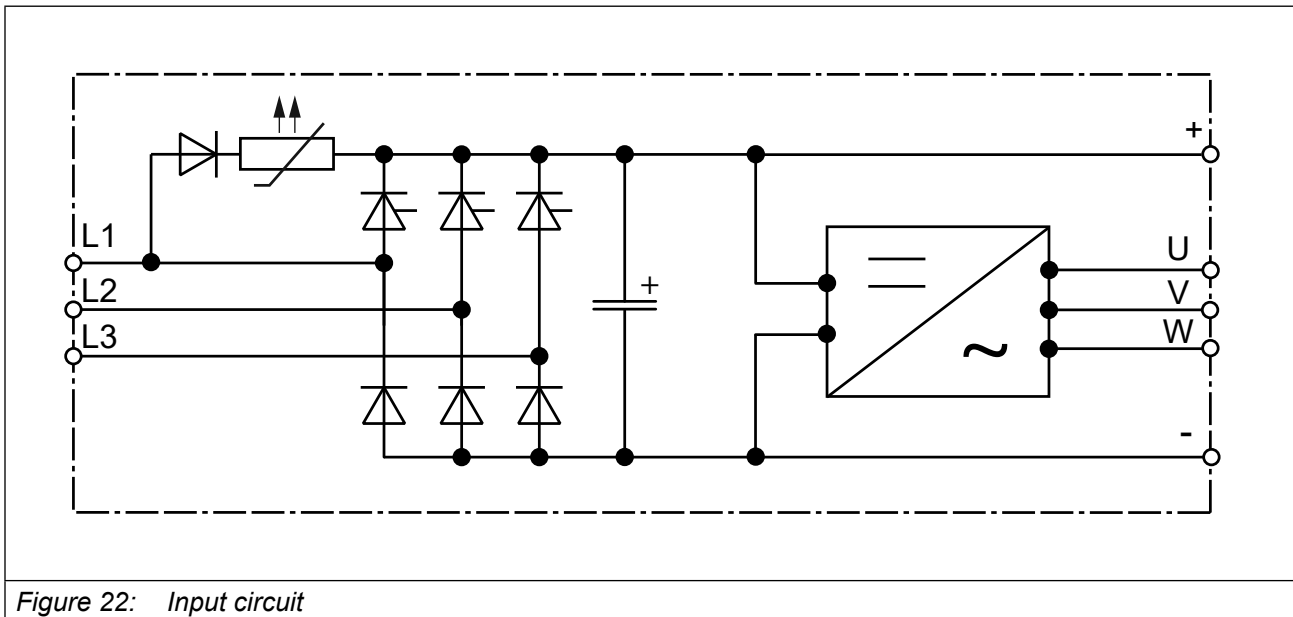

Figure 22: Input circuit

NOTICE

With AC power supply, observe the minimum waiting time between two switch-on procedures!

Cyclical switching off and on of the drive controller leads to temporary high impedance of the PTC precharging resistor. After the PTC precharging resistor has cooled down, it can be restarted without restrictions. The waiting time between two switch-on processes depends on the external capacitance, the AC mains voltage and the ambient temperature.

- ▶ Without external capacity: 5 min
- ▶ With external capacity (additional drive controllers): 20 min

NOTICE

No inrush current limitation with DC power supply!

- ▶ An external inrush current limiter must be provided for DC power supplies.

5.2.2.2 Functional earthing

A functional earthing may also be necessary, if for EMC requirements additional potential equalization between devices or parts of the system must be available.

The use of the functional earth (FE) is not required if the frequency inverter is EMC-technically wired.

The functional earth may not be wired green/yellow!

Notes on EMC-compatible installation can be found here.

5.3 Mains connection

5.3.1 Supply cable

The conductor cross-section of the supply cable is determined by the following factors:

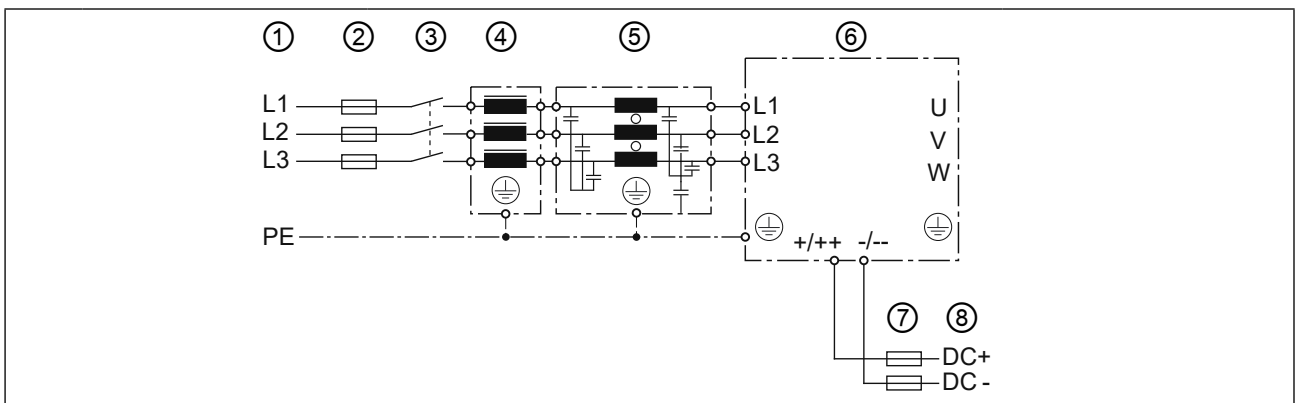

- Input current of the drive controller
- Used line type
- Installation and ambient temperatures
- The locally valid electrical regulations

The application engineer is responsible for the design!

5.3.4.3 Selection of the motor line

The correct cabling as well as the motor line itself play an important part in case of low power in connection with long motor line lengths. Low-capacitance line (phase/phase < 65 pF/m, phase/screen < 120 pF/m) at the inverter output have the following effects:

- allow major motor line lengths („5.3.4.4 Motor cable length and conducted interferences at AC supply“)
- better EMC properties (reduction of the common-mode output currents to earth)

	<p>The use of shielded motor lines with symmetrical structure is required for higher motor power (from 30 kW). In these lines the protective earth conductor is tripartite and evenly arranged between the phase lines. A cable without protective earth conductor can be used if local regulations so permit. Then the protective earth conductor must be laid externally. Certain lines also permit the shield for the use as protective earth conductor. For this, observe the details of the line manufacturer!</p>
<p>Figure 30: Symmetrical motor line</p>	

5.3.4.4 Motor cable length and conducted interferences at AC supply

The maximum motor cable length is depending on the capacity of the motor cable as well as on the EMC emitted interference. External measures must be taken here (e.g. the use of a line filter).

The cable length can be increased significant by using motor chokes or motor filters. KEB recommends the use of motor chokes or filters for a cable length upto 25m.

Further information on the motor cable length can be found in the corresponding filter instructions.

5.3.4.5 Motor cable length for parallel operation of motors

The resulting motor cable length for parallel operation of motors, or parallel installation with multiple cables arises from the following formula:

$$\text{Resulting motor cable length} = \sum \text{single cable length} \times \sqrt{\text{Number of motor cables}}$$

5.3.4.6 Motor cable cross-section

The motor cable cross-section is dependent

- on the characteristic of the output current (e.g. harmonic content)
- on the real effective value of the motor current
- on the cable length
- on the type of the used cable
- on the ambient conditions such as bundling and temperature

5.3.4.7 Interconnection of the motor

NOTICE

Incorrect behavior of the motor!

- ▶ The connecting-up instructions of the motor manufacturer are always generally valid!

NOTICE

Protect motor against voltage peaks!

- ▶ Drive controllers switch at the output with high dV/dt . Voltage peaks that endanger the insulation system at the motor can occur especially in case of long motor cables (>15 m). A motor choke, a dV/dt -filter or sine-wave filter can be used to protect the motor with regard to the operating mode.

5.3.4.8 Connection of the temperature monitoring and brake control (X1C)

A switchable temperature evaluation is implemented in the COMBIVERT.

There are different types for the evaluation available. These are depending on the control board => *instruction manual „control board“*.

The desired operating mode can be adjusted via software (dr33). If the evaluation is not required, it must be deactivated via software (parameter pn12 = 7) => *Programming manual*

NOTICE

Malfunctions due to incorrect line or laying!

Malfunctions of the control due to capacitive or inductive coupling.

- ▶ Do not route cables from the motor temperature sensor (also shielded) together with control cables.
- ▶ Cables from the motor temperature sensor within the motor cables may only be used with double shielding!
- ▶ The input of the temperature detection has basic isolation.

		<p>For control board APPLICATION and COMPACT. The voltage to the control of a brake is decoupled from the internal voltage supply.  - ▶ KTY sensors may not be combined with other detections.

Further information about the wiring of the temperature monitoring and the brake control have to be observed in the respective control unit manual.

5.3.5 Connection and use of a braking resistor

⚠ CAUTION

Fire risk by using brake resistors!

- ▶ The risk of fire can be significantly reduced by using „intrinsically safe braking resistors“ or by using suitable monitoring functions / circuits.

NOTICE

Destruction of the frequency inverter if the value has fallen below the minimum brake resistance value!

- ▶ The minimum brake resistance value must not fall below!

⚠ CAUTION

Hot surfaces caused by load of the braking resistor!

Burning of the skin!

- ▶ Cover hot surfaces safe-to-touch.
- ▶ Before touching, check the surface.
- ▶ If necessary, attach warning signs on the system.

5.3.5.2 Use of non-intrinsically safe braking resistors

⚠ WARNING

Use of non-intrinsically safe braking resistors

Fire or smoke emission in case of overload or error!

- ▶ Only use braking resistors with temperature sensor.
- ▶ Evaluate temperature sensor.
- ▶ Trigger an error at the drive controller (e.g. external input).
- ▶ Switch off input voltage (e.g. input contactor).

5.3.6 DC-bus connection

The DC link of several drive controllers are coupled in a DC-bus connection. This enables energy to be exchanged between the devices and increases the energy efficiency of the application.

As part of a DC-bus connection, this drive controller can either be supplied via the DC terminals => „5.3.3 DC mains connection“ or supply other drive controllers via the DC terminals => „5.3.2 AC mains connection“.

KEB drive controllers meet the requirements of the EMC product standard EN IEC 61800-3 for DC power supplies. Due to the large number of possible interconnection options in the DC network, the user is responsible for ensuring the conformity of the overall system.

The following additional safety instructions must be observed when using this drive controller in a DC-bus connection:

- This drive controller may only be operated together with other F6 and S6 drive controllers of the 400V class in a DC-bus connection.
- This drive controller must be installed in an enclosure.
- This drive controller must be protected with fuses at the DC terminals => „3.2.6.2 Fuse protection of the 400 V units at DC-supply“.
- If one fuse in the DC-bus connection blows as a result of a short circuit, all fuses in the DC-bus connection should be replaced due to the risk of prior damage.
- The parameterisation of the input phase failure detection must be adapted => F6 Programming manual.

① When using this drive controller to supply other drive controllers via the DC terminals, the following must also be observed:

- The maximum prechargeable total capacity (internal capacity + external capacity) must not be exceeded => „3.3.2.1 DC link / braking transistor function“.
- The minimum waiting time between two precharging procedures must be observed => „5.2.1 Connection of the voltage supply“.
- Drive controllers supplied via the DC terminals must not be loaded during precharging.
- Overloading of the rectifier must be prevented by the user => „3.2.4 Overview of rectifier data for 400 V devices“.

② When supplying this drive controller via the DC terminals, the following must also be observed:

- The drive controller must be pre-charged by the supplying drive controller or an external pre-charging module.

5.3.7 External heat sink fan supply (FAN)

The external heat sink fan supply is only available for air-cooled devices.

The control board and heat sink fans should be powered by separate external voltage sources.

In the event of a fault in the heat sink fans, this provides an uninterrupted supply of power to the control system.

Avoid overheating errors by adjusting the fan voltage.

The voltage supply across the supply line must be taken into account when supplying power to the fans.

The voltage at the FAN terminal must be 24V at full fan speed. KEB recommends a voltage source with adjustable output voltage.

NOTICE

Use of unsuitable voltage sources!

Electric shock!

- ▶ Only voltage sources (PELV) according to VDE 0100 permitted.
 - ▶ Ensure that the overvoltage category of the voltage supply is sufficient.
 - ▶ Observe the tripping characteristics of the fuses when selecting the voltage source for the heat sink fan supply.
-

6 Operation of Liquid-Cooled Devices

6.1 Water-cooled devices

The use of water-cooled KEB COMBIVERT drive converters is offered, because there are process-caused coolants available with some applications. However, the following instructions must be observed.

6.1.1 Heat sink and operating pressure

Design system	Material	max. operating pressure	Connection
Aluminium heat sink	Aluminium -1,67 V	10 bar	=> „6.1.4 Connection of the cooling system“

NOTICE

Deformation of the heat sink!

- ▶ In order to avoid a deformation of the heat sink and the damages thereby, the indicated maximum operating pressure may not be exceeded briefly also by pressure peaks.
- ▶ Observe the Pressure Equipment Directive 2014/68/EU!

6.1.2 Materials in the cooling circuit

For the screw connections and also for the metallic articles in the cooling circuit which are in contact with the coolant (electrolyte) a material is to be selected, which forms a small voltage difference to the heat sink in order to avoid contact corrosion and/or pitting corrosion (electro-chemical voltage series, see the following table). The specific case of application must be checked by the customer in tuning of the complete cooling circuit and must be classified according to the used materials. With hoses and seals take care that halogen-free materials are used.

A liability for occurring damages by wrongly used materials and from this resulting corrosion cannot be taken over!

6.1.3 Requirements for the coolant

The requirements for the coolant depend on the ambient conditions as well as the used cooling system.

General requirements for the coolant:

Requirement	Description
Standards	Corrosion protection according to <i>EN 12502-1...5</i> , water treatment and use of materials in cooling systems according to <i>VGB S 455 P</i> .
VGB Cooling water directive	The VGB cooling water directive (<i>VGB S 455 P</i>) contains instructions about common process technology of the cooling. Particularly the interactions between cooling water and components of the cooling system are described.
Abrasive substances	Abrasive substances as used in abrasive (quartz sand), clogging the cooling circuit.
Hard water	Cooling water may not cause scale deposits or loose excretions. The total hardness should be between 7...20 °dH, the carbon hardness at 3...10 °dH.
Soft water	Soft water (<7°dH) corrodes the material.
Frost protection	An appropriate antifreeze must be used for applications when the heat sink or the coolant is exposed temperatures below zero. Use only products of one manufacturer for a better compatibility with other additives. KEB recommends the antifreeze Antifrogen N from Clariant with a maximum volume content of 52 %.
Corrosion protection	Additives can be used as corrosion protection. In connection with frost protection the antifreeze must have a concentration of 20...25Vol %, in order to avoid a change of the additives. Alternatively, an antifreeze / glycol with a concentration of 20% ... max. vol 52% can be used. If antifreeze is used, the water does not need to be provided with additional additives.

Table 35: Requirements for the coolant

Special requirements for open and half-open cooling systems:

Requirement	Description
Impurities	Mechanical impurities in half-open cooling systems can be counteracted when appropriate water filters are used.
Salt concentration	The salt content can increase through evaporation at half-open systems. Thus the water is more corrosive. Adding of fresh water and removing of process water works against.
Algae and myxobacteria	Algae and myxobacteria can arise caused by increased water temperature and contact with atmospheric oxygen. The algae and myxobacteria clog the filters and obstruct the water-flow. Biocide containing additives can avoid this. Especially at longer OFF periods of the cooling circuit preventive maintenance is necessary.
Organic materials	The contamination with organic materials must be kept as small as possible, because separate slime can be caused by this.

Table 36: Special requirements for open and half-open cooling systems

Damages at the device which are caused by clogged, corroded heat sinks or other obvious operating errors, leads to the loss of the warranty claims.

6.1.4 Connection of the cooling system

The connection to the cooling system can occur as closed or open cooling circuit. The connection to a closed cycle cooling circuit is recommended, because the danger of contamination of coolant is very small. Preferably also a monitoring of the pH value of the coolant should be installed.

Pay attention to a corresponding conductor cross-section at required equipotential bonding in order to avoid electro-chemical procedures.

=> „6.1.2 Materials in the cooling circuit“

Other elements in the cooling circuit such as pumps, shut-off valves, ventilation etc. must be attached according to the cooling system and the local conditions.

No.	Connection	Type
1	Flow	Open pipe ends for the connection of the cooling system Pipe diameter outside: 12 mm
2	Return flow	

Figure 38: Open pipe ends for the connection of the cooling system

For the connection of the cooling system KEB recommends the use of functional nuts, e.g. from the manufacturer "Parker", type FMxxL71 (xx = pipe diameter).

To monitor the volume flow in the cooling system KEB recommends the use of a volume flow monitor.

6.1.5 Coolant temperature and moisture condensation

The flow temperature should be selected depending on the volume flow so that the heat sink temperature is always 10 K below the overtemperature level (OH) during rated operation. This avoids sporadic shutdown.

The maximum heat sink temperature can be found in chapter => „3.3.1 Switching frequency and temperature“.

6.1.5.1 Condensation

A temperature difference between drive converter and ambient temperature can lead to condensation at high humidity.

Moisture condensation is dangerous for the drive converter. The drive converter can be destroyed through occurring short-circuits.

NOTICE

Destruction of the drive converter due to short circuit!

► Avoid any condensation.

6.1.5.2 Supply of temper coolant

- The supply of optimally tempered coolant is possible by using heaters in the cooling circuit to control the coolant temperature.
- The following dew point table shows the coolant inlet temperature depending on the ambient temperature and air humidity.

Air humidity / %	10	20	30	40	50	60	70	80	90

NOTICE

Destruction of the heat sink at storage / transport of water-cooled devices!

Observe the following points when storing water-cooled devices:

- ▶ Completely empty the cooling circuit
- ▶ Blow out the cooling circuit with compressed air

NOTICE

Destruction of the drive converter due to condensation!

- ▶ Use only NC valves!

6.1.6 Permissible volume flow with water cooling

The volume flow of the following table must be observed.

Permissible volume flow		
Min. volume flow	Q_{min} / l/min	6
Max. volume flow	Q_{max} / l/min	20

Table 38: Permissible volume flow with water cooling

The volume flow depends on the total power dissipation.
=> „6.1.7 Coolant heating“

NOTICE

Destruction of the heat sink due to erosion!

- ▶ The maximum permissible volume flow must not be exceeded.

6.1.7 Coolant heating

Volume flow depending on the total power dissipation and temperature difference between flow and return flow.

¹⁾ P_{D_ges} can be higher than the power dissipation PD during rated operation due to overload, higher switching frequency or sub-mounted braking resistors.

6.1.8 Typical pressure drop of the heat sink

- The curve characteristic shown below is valid for 25 °C flow temperature and a glycol content of 52 %.
- If higher flow temperatures are used, the pressure drop in the system decreases.
- This also applies to cooling media such as water or another glycol mixture.
- A glycol mixture from Clariant in a ratio of 52 % or 33 % is recommended.

6.2 With high-performance heat sink

Water-cooled KEB COMBIVERT drive controller are ideal for applications in which cooling fluid is required due to the nature of the process. However, the following instructions must be observed when using the product.

6.2.1 Heat sinks and operating pressure

Design system	Material	Max. operating pressure	Connection
aluminium heat sink	Aluminium -1.67 V	10 bar	=> „6.2.4 Connection of the high-performance heat sink“

NOTICE

Deformation of the heat sink!

- ▶ To prevent deformation of the heat sink and the associated consequential damage, the specified maximum operating pressure must not be exceeded, even for short periods, including during pressure peaks.
- ▶ The Pressure Equipment Directive 2014/68/EU on pressure equipment must be observed!

6.2.2 Materials in the cooling circuit

For screw connections and metal objects in the cooling circuit that come into contact with the coolant (electrolyte), a material should be selected that has a low voltage difference to the heat sink so that no contact corrosion and/or pitting occurs (electrochemical series, see table below). The specific application must be checked by the customer in coordination with the entire cooling circuit and classified accordingly with regard to the suitability of the materials used. When using hoses and seals, care must be taken to ensure that halogen-free materials are used.

We cannot accept liability for damage caused by incorrectly used materials and resulting corrosion!

6.2.3 Requirements for coolant for high-performance heat sinks

The requirements for the coolant depend on the environmental conditions and the cooling system used.

General requirements for the coolant:

Requirement	Description
standards	Corrosion protection in accordance with <i>DIN EN 12502-1...5</i> , water treatment and use of materials in cooling systems according to <i>VGB S 455 P</i> .
VGB cooling water guideline	The VGB Cooling Water Guideline (<i>VGB S 455 P</i>) contains information on common cooling process technologies. In particular, the interactions between the cooling water and the components of the cooling system are described.
Abrasives	Abrasive substances, such as those used in scouring agents (quartz sand), clog the cooling circuit.
Hard water	Cooling water must not cause water scale deposits or loose deposits. The total hardness should be between 7 and 20 °dH, and the carbon hardness between 3 and 10 °dH.
Soft water	Soft water (<7°dH) attacks the materials.
Frost protection	For applications in which the heat sink or cooling fluid is exposed to temperatures below 0°C, an appropriate antifreeze agent must be used. For better compatibility with other additives, it is best to use products from one manufacturer. KEB recommends the antifreeze Antifrogen N from Clariant with a maximum volume proportion of 52%.
Corrosion protection	Additives can be used as corrosion protection. In combination with antifreeze, the antifreeze must have a concentration of 20–25% by volume to prevent any change in the additives. Alternatively, antifreeze/glycol with a concentration of 20% ... max. vol. 52% can be used. If antifreeze is used, there is no need to add any additional additives to the water.

Table 40: Requirements for the coolant

Special requirements for open and semi-open cooling systems:

Requirement	Description
Impurities	Mechanical impurities in semi-open cooling systems can be counteracted by using appropriate water filters.
Salt concentration	In semi-open systems, evaporation can cause the salt content to rise. This makes the water more corrosive. Adding fresh water and removing service water counteracts this.
Algae and myxobacteria	Algae and myxobacteria can form due to the increased water temperature and contact with atmospheric oxygen. These clog the filters and thus impede the flow of water. Additives containing biocides can prevent this. This should be prevented, especially during prolonged standstill of the cooling circuit.
Organic substances	Contamination with organic substances must be kept to a minimum, as this causes sludge deposits to form.

Table 41: Special requirements for open and semi-open cooling systems:

NOTICE

Loss of warranty claims!

- Damage to the device resulting from clogged, corroded heat sinks or other obvious misuse will void the warranty claims.

6.2.4 Connection of the high-performance heat sink

The connection to the cooling system can be made as a closed or open cooling circuit. Connection to a closed cooling circuit is recommended, as the danger of contamination of the coolant is very low. Preferably, a monitoring system for the pH value of the coolant should also be installed.

When performing the necessary potential equalisation, ensure that the conductor cross-section is appropriate in order to minimise electrochemical processes.

=> „6.2.2 Materials in the cooling circuit“

Additional elements in the cooling circuit, such as pumps, shut-off valves, ventilation, etc., must be added in accordance with the cooling system and circumstance.

No.	Connection	Type
1	Flow	Open pipe ends for the connection of the cooling system Pipe diameter outside: 18 mm
2	Return flow	

Figure 41: Open pipe ends for the connection of the cooling system

For the connection of the cooling system KEB recommends the use of functional nuts, e.g. from the manufacturer "Parker", type FMxxL71 (xx = pipe diameter).

The recommended tightening torque is 80Nm.

To monitor the volume flow in the cooling system KEB recommends the use of a volume flow monitor.

6.2.5 Coolant temperature and moisture condensation

The flow temperature should be selected depending on the volume flow so that the heat sink temperature is always 10 K below the overtemperature level (OH) during rated operation. This avoids sporadic shutdown.

The maximum heat sink temperature can be found in chapter => „3.3.1 Switching frequency and temperature“.

6.2.5.1 Condensation

A temperature difference between drive converter and ambient temperature can lead to condensation at high humidity.

Moisture condensation is dangerous for the drive converter. The drive converter can be destroyed through occurring short-circuits.

NOTICE

Destruction of the drive converter due to short circuit!

- ▶ Avoid any condensation.

6.2.5.2 Supply of temper coolant

- The supply of optimally tempered coolant is possible by using heaters in the cooling circuit to control the coolant temperature.
- The following dew point table shows the coolant inlet temperature depending on the ambient temperature and air humidity.

Air humidity / %	10	20	30	40	50	60	70	80	90
Ambient temperature / °C									
-10	-34	-26	-22	-19	-17	-15	-13	-11	-11

Table 42: Dew point table

Information on coolant management is given in the following document

www.keb.de/fileadmin/media/Techinfo/dr/an/tj_dr_an-liquid-cooling-00004_en.pdf

NOTICE

Destruction of the heat sink at storage / transport of water-cooled devices!

Observe the following points when storing water-cooled devices:

- ▶ Completely empty the cooling circuit
- ▶ Blow out the cooling circuit with compressed air

NOTICE

Destruction of the drive converter due to condensation!

- ▶ Use only NC valves!

6.2.6 Permissible volume flow for high-performance heat sinks

The volume flow of the following table must be observed.

Permissible volume flow		
Min. volume flow	Q_{min} / l/min	20
Max. volume flow	Q_{max} / l/min	30

Table 43: Permissible volume flow with water cooling

The volume flow depends on the total power dissipation.
=> „6.1.7 Coolant heating“

NOTICE

Destruction of the heat sink due to erosion!

- ▶ The maximum permissible volume flow must not be exceeded.

6.2.7 Coolant heating for high-performance heat sinks

Volume flow depending on the total power dissipation and temperature difference between flow and return flow.

¹⁾ P_{D_ges} can be higher than the power dissipation PD during rated operation due to overload, higher switching frequency or sub-mounted braking resistors.

6.2.8 Typical pressure drop of the high-performance heat sink

- The curve characteristic shown below is valid for 25 °C flow temperature and a glycol content of 52 %.
- If higher flow temperatures are used, the pressure drop in the system decreases.
- This also applies to cooling media such as water or another glycol mixture.
- A glycol mixture from Clariant in a ratio of 52 % or 33 % is recommended.

7 Approvals and certifications

7.1 CE-Marking

The drive controller marked with a CE logo comply with the requirements specified by European Union guidelines. The CE Declaration of Conformity is available on the Internet at www.keb-automation.com/de/suche.

For further information regarding the CE declarations of conformity

=> „7.4 Further informations and documentation“

7.2 Marine version

The operating temperature range covers +5°C to +55°C (ambient) as the maritime type testing was successfully performed across the range of 5°C to 70°C.

Marine versions of drive controller can be identified by the following nameplate..

Legend
1 Optional customer number
2 Customer-specific material number
3 If applicable, a maritime classification society that certifies routine inspections

When the ambient temperature reaches 45°C or higher, the power dissipation must be reduced.

Power dissipation can be reduced through the following measures, among others.:

- Reduce the output power by 5% per 1 K.
- A reduction in switching frequency.
- A reduction in the load at the control card interface.

The user must ensure that the internal temperature of the product does not exceed 70 °C (maximum permissible internal temperature).

If the interior temperature exceeds 70 °C, the error message “Error! Interior Overheating” is displayed.

7.3 UL certification

	Acceptance according to UL is marked at KEB drive converters with the adjacent logo on the nameplate.	UL file number E167544
---	---	---------------------------

To be conform according to UL for use on the North American and Canadian Market the following additionally instructions must be observed (original text of the UL-File):

- All models:
Maximum Surrounding Air Temperature: 45°C
- Use 75°C Copper Conductors Only

This marking is only applicable for all power field wiring terminals.

- Control Circuit Overcurrent Protection Required
- External Break resistor ratings and duty cycle:
 - Duty cycle 50%
 - Max. 60 sec on-time (60 sec off-time)
- Sub-mounted brake resistor ratings and duty cycle
 - Duty cycle 0.75%
 - Max. 0.9 sec on-time / 119.1 sec off-time
- For the DC bus terminals and the mains/motor terminals, the installation instructions or user maintenance manual shall identify any accessible part at voltages greater than DVC A, and shall describe insulation and separation provisions required for protection.
- All models: „Suitable For Use On A Circuit Capable Of Delivering Not More Than 18000 rms Symmetrical Amperes, 480 Volts Maximum when protected by Class J Fuses, see instruction manual for Branch Circuit Protection details.”
All models: „Suitable For Use On A Circuit Capable Of Delivering Not More Than 100,000 rms Symmetrical Amperes, 480 Volts Maximum when protected by Semiconductor Fuses by SIBA, Type 20 610 32.xxx, or by Bussmann, Type 170M4xxx or by Littelfuse, Type PSR030yy, see instruction manual for Branch Circuit Protection details.”
- Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the Manufacturer Instructions, National Electrical Code and any additional local codes.
CSA: For Canada:
Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the Canadian Electrical Code, Part I.
LA PROTECTION INTÉGRÉE CONTRE LES COURTSCIRCUITS N'ASSURE PAS LA PROTECTION DE LA DÉRIVATION. LA PROTECTION DE LA DÉRIVATION DOIT ÊTRE EXÉCUTÉE CONFORMÉMENT AU CODE CANADIEN DE L'ÉLECTRICITÉ, PREMIÈRE PARTIE.
- For Use in a Pollution Degree 2 environment
For installations according to Canadian National Standard C22.2 No. 274-13:
For use in Pollution Degree 2 and Overvoltage Category III environments only

- **WARNING** – The opening of the branch circuit protective device may be an indication that a fault current has been interrupted. To reduce the risk of fire or electrical shock, current-carrying parts and other components of the controller should be examined and replaced if damaged. If burnout of the current element of an overload relay occurs, the complete overload relay must be replaced.”

CSA: For Canada:

“ATTENTION - LE DÉCLENCHEMENT DU DISPOSITIF DE PROTECTION DU CIRCUIT DE DÉRIVATION PEUT ÊTRE DÙ À UNE COUPURE QUI RÉSULTE D'UN COURANT DE DÉFAUT. POUR LIMITER LE RISQUE D'INCENDIE OU DE CHOC ÉLECTRIQUE, EXAMINER LES PIÈCES PORTEUSES DE COURANT ET LES AUTRES ÉLÉMENTS DU CONTRÔLEUR ET LES REMPLACER S'ILS SONT ENDOMMAGÉS. EN CAS DE GRILLAGE DE L'ÉLÉMENT TRAVERSÉ PAR LE COURANT DANS UN RELAIS DE SURCHARGE, LE RELAIS TOUT ENTIER DOIT ÊTRE REMPLACÉ.

- For liquid cooled devices:
 - Maximum working pressure: 10 bar (145 psi)
 - Max. inlet liquid temperature: +55°C
 - Min. liquid flow rate: 6 l/min
 - Water or a mixture of water with a maximum of 52% monoethylene glycol
- For high performance:
 - Maximum working pressure: 10 bar (145 psi)
 - Max. inlet liquid temperature: +55°C
 - Min. liquid flow rate: 20 l/min
 - Water or a mixture of water with a maximum of 52% monoethylene glycol
